NO ENTRY FOR DIRT & GERMS

MYK LATICRETE GROUTS
A recent development in the construction industry, grouts are fillers for the space between adjoining tiles laid either on the floor or walls.

Traditionally, and even today, tiling is done by placing tiles close to each other without using grouts. This, however, leads to numerous problems including chipping of tile corners as they are unable to bear the load during structural movement.

Non-use of grouts leads to various problems such as:

- Accumulation of stain and dirt between tiles, makes appearance of floors and walls ugly.
- Tile joints especially in kitchens get stained easily due to exposure to oil, spices etc. The stains further give breeding ground to bacteria and fungus, which is hazardous to health.
- Acid cleaners used to clean bathrooms etc seep through the gap and react with cement, thus debonding the tiles.
- There is a possibility of water seepage into the underlaying layer of concrete through the gaps between tiles leading to long term leakage problems.

To overcome these problems, MYK LATICRETE has introduced an innovative range of grouts.

Advantages:

- Easy to apply
- Stainfree tile joints
- Non-cracking or powdering
- Anti-fungal & anti-bacterial
- Available in a range of 40 colours to suit your tile colour
- Acid/chemical resistant (epoxy based grouts only)
## Grout selector table

<table>
<thead>
<tr>
<th>Area of Application</th>
<th>Product System Recommendation</th>
